8-stage shift-and-store bus register

74HC/HCT4094

FEATURES

- Output capability: standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT4094 are high-speed Si-gate CMOS devices and are pin compatible with the "4094" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4094 are 8-stage serial shift registers having a storage latch associated with each stage for strobing data from the serial input (D) to the parallel buffered 3-state outputs (QP₀ to QP₇). The parallel outputs may be connected directly to common bus lines. Data is shifted on the positive-going clock (CP) transitions.

The data in each shift register stage is transferred to the storage register when the strobe input (STR) is HIGH. Data in the storage register appears at the outputs whenever the output enable input (OE) signal is HIGH.

Two serial outputs (QS₁ and QS₂) are available for cascading a number of "4094" devices. Data is available at QS₁ on the positive-going clock edges to allow high-speed operation in cascaded systems in which the clock rise time is fast. The same serial information is available at QS₂ on the next negative-going clock edge and is for cascading "4094" devices when the clock rise time is slow.

APPLICATIONS

- Serial-to-parallel data conversion
- Remote control holding register

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL} / t _{PLH}	propagation delay	C _L = 15 pF; V _{CC} = 5 V			
	CP to QS ₁		15	19	ns
	CP to QS ₂		13	18	ns
	CP to QP _n		20	21	ns
	STR to QP _n		18	19	ns
f _{max}	maximum clock frequency		95	86	MHz
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per package	notes 1 and 2	83	92	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

∑ (C_L × V_{CC}² × f_o) = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is V_I = GND to V_{CC}
For HCT the condition is V_I = GND to V_{CC} – 1.5 V
